

The MEDNAwise research report encompasses a comprehensive analysis of CPIC low to moderate level of evidence drugs, spanning across 2A, 2B, 3, and 4 CPIC levels of evidence. This extensive report covers approximately 237 drugs across various specialties, drawing insights from the evolving scientific evidence available in the PharmGKB database.

It is essential to note that this report is intended solely for research purposes. While it provides valuable insights into pharmacogenetics, clinicians are advised to exercise their clinical judgment when making decisions based on the information presented. The report serves as a valuable resource, shedding light on the genetic factors influencing drug response, but it is crucial for clinicians to consider this information within the broader context of their professional expertise.

Our commitment to delivering accurate and insightful data aligns with the evolving landscape of pharmacogenomics, and this report is a testament to our dedication to advancing genetic research. We encourage clinicians to leverage this resource for its utility in understanding the genetic underpinnings of drug response, always keeping in mind its intended purpose for research exploration.
